

Reduce Risk in the Cloud

1. Encrypt your files (most cloud software providers include these feature - otherwise, there are many third party options).
2. Create local (on your computer's hard drive) back-ups of your files.
3. Monitor user access (you should be aware of who has access and to which files they have access).
4. Log user access (enables you to pinpoint when a file is accessed, and by whom - assists in detecting nefarious access).
5. Limit the number of of sensitive files saved in the cloud (banking details, IP details and confidential information).
